Hypertherm®

Data Sync

## ProNest® optional module

Data Sync links ProNest to your ERP/MRP* software, providing the communication framework needed to exchange job information (such as parts and plates) in real time.

Data Sync is required for all ProNest integrations with third-party ERP/MRP software.

Setup is quick and easy for most users, and Data Sync works with virtually any brand of ERP/MRP software, including steel fabrication management software.

Once activated, Data Sync allows ProNest users to automatically access ERP/MRP data directly inside the part list or plate list for immediate nesting. Updated data can then be returned to the ERP/MRP system.

Here is what people are saying about Data Sync:

"It took a large burden away from the programming process. What used to take four hours to complete now takes only 20 minutes."

– Rick Kirkpatrick, Top Tier, Inc.

ERP/MRP	ProNest
Parts plates	Nesting • Automatic nesting • Advanced processes • NC output
Data Sync	
Reporting	

Depending on your brand of ERP/MRP software, Data Sync may provide all the functionality that you need to run a fully data driven operation. In other cases, additional ProNest modules may be recommended to help drive your business. These may include Plate Inventory and Work Order Processing.

For more information, and to determine the right modules for your particular integration, please contact a Hypertherm representative.
